

Professor and Class,

This week, we will examine the normal distribution's operation and its applications to numerous medical and health-related scenarios. This week's assignments have been really helpful in helping me grasp this. So far, Knewton has proven to be the most successful in my learning process. If there are any videos on a deeper comprehension that I don't comprehend, Youtube has also been helpful

Professor and Class,

The goals of the course for this week, which is week 5 of the course, are to learn the measures of data identification, the standard normal distribution, how to apply the normal distribution, the central limit theorem for sample means, and how to apply it, and the central limit theorem for proportions.

With the help of the assignments for the week, we will be able to achieve those goals because they will give us practice questions that will direct us toward reaching a level of mastery. Further, the assignments will improve my familiarity with the course in general and the course objectives, which as a result, will help me become more knowledgeable about the subject matter that is being covered, which is helped by the fact that the assignments are tailored to the weekly goals that have been established.
