The 2 innovators that I feel related the most but are also very different are Thomas Edison and Steve Jobs. Some ways that they compare are they both revolutionized their eras by advancing the technology that a lot of people use in their everyday lives to make things easier for them.

Thomas Edison for example made the light bulb and that almost helped everyone on the planet, there is no one in 2026 that does not use a light bulb so that helped everyone in a huge way that was a win for humanity people went from gas to electric which also helped with air pollution and gas was able to be saved along with so many other things it was a huge success. Another thing he created was the Phonograph which was a thing able to capture and release sound like a speaker. But also it says when researching that Thomas Edison “Focused on systematic industrial research to build infrastructure (White)”. Thomas Edison seemed to invent more industrial things and also electrical things and stuff that’s needed in the work place for it to function more easily. Also a lot of testing and commercialization he has over 1,000 patents and it says “He operated as a system builder when it came to inventing things and being innovative (Bowers)”. Steve Jobs and Thomas Edison both focused on forwarding humanity when it came to their innovations because even though they are in two different eras they advanced humanity in a lot of ways but are also different.

Steve Jobs focused on “Integrating art, technology, and marketing to create intuitive consumer electronics (White)”. So things like the iPhone and Mac those 2 things advanced us so
