

Revisit the goals and objectives from your Practicum Experience Plan. Explain the degree to which you achieved each during the practicum experience.

Having revisited the goals and objectives from the practicum experience plan, I am confident that I have realized the objective of the practicum because I managed to develop the respective diagnoses for the patients according to the present symptoms. Moreover, I was able to apply the DSM-5 diagnostic criteria for evaluating the diagnostic measures to ascertain the presenting symptoms for the patient. Additionally, I was able to create an assessment plan to evaluate the patient's effectiveness regarding the medications prescribed. Moreover, I was able to identify with the treatment plan by demonstrating the primary objective symptoms that would guide appointments to come.

Reflect on the three most challenging patients you encountered during the practicum experience. What was most challenging about each?

During the practicum experience, the three notable challenges include the following; the first challenge involves non-compliance from selective patients who would not adhere to medications prescribed. The second challenge experienced during the practicum experience involved few patients who focused on medication management measures because this is essential in ensuring the general well-being. The third primary challenge experienced during the practicum experience involves having few patients focused on legal regulations compared to those adhering to psychiatric interventions. It is essential that patients focus on legal regulations because they determined healthcare outcome and the nature of healthcare administration.

What did you learn from this experience?

During the practicum experience, one of the essential lessons learned include developing effective skills that allows respectful experience with patients. Notably, I learned that it is essential that healthcare providers set healthy boundaries with patients because in most cases, healthcare providers become accustomed to the challenges faced by patients which can impede their service delivery. Therefore, during this experience, I learned that the most essential strategy when managing patients involves demonstrating empathy when addressing patient needs and setting healthy boundaries that would ensure.

What evidence-based practice did you use for the patients. Notably, healthcare practitioners should ensure healthcare according to patients' outcomes. Krause3a2021, mapped identified with the differences with prescribed groups, the study highlights the differences between the stake healthcare groups including the psychotherapy in management of physiotherapy. The other study that informed this study includes the Aranha et al., 2020, which includes evaluations about the effectiveness about informed practicum experience which demands effectiveness of functional Analytics experience which evaluates the effectiveness of functional analytics psychotherapy on clinic relevant behaviors in the context of substance abuse and identifies.

The required evidence is by the. While acknowledging my strengths, it is evident that there are distinct areas where further growth opportunities exist. A noteworthy prospect for
