

WHAT DO I LEARN EXCEL?

What did you learn this week?

I learned about absolute, relative, and mixed cell references.

- Before this week I was entering the column and row locations manually
- Now I know I can use the absolute cell reference to always point to a certain location (Wempen, 2016).

Cell Reference

The image shows two examples of Excel cell references. The top example shows a formula bar with the formula `=D10*E` and a spreadsheet with columns C (PRODUCT), D (QUANTITY), and E (PRICE). The bottom example shows a formula bar with the formula `=$D22*` and a spreadsheet with columns D and E, where row 22 is highlighted.

	C	D	E
9	PRODUCT	QUANTITY	PRICE
10	CROCIN	144	55
11	DOLO	133	64
12	CALPOL	90	49
13	PACIMOL	140	53

	D	E
21		1
22	1	1
23	2	2
24	3	3
